NUWRO 18.02 IS NOW AVAILABLE!

This is an amazing news for the neutrino community. NuWro Collaboration has just announced the new release of their flag product. It is time to get excited! Lets see the most significant changes.

to experimental data for Carbon and Iron as a function of proton momentum. The agreement is superb!

- PION_AXIAL_MASS
- PION_C5A

Reweighting

Final remarks

New NN cross sections

It is the beginning of a revolution. The new framework for incorporating cross section data for nucleon-nucleon and pion-nucleon processes was introduced in the intranuclear cascade. It allows easily to update all re-interactions parameters to improve the model of final state interactions implemented in NuWro.

The NN scattering data from PDG was included in NuWro 18.02. The figure above presents the nuclear transparency ratio of NuWro 18.02 prediction

The first work on reweighting tools for NuWro was done by Luke Pickering and Patrick Stowell. Following their steps the NuWro team is including more and more knobs into the main code. Some new structures were introduced, some parts were rewritten from scratch. Long story short, reweighting is included in NuWro 18.02. As for today, the following parameters are available:

- QEL_CC_AXIAL_MASS
- QEL_NC_AXIAL_MASS
- QEL_S_AXIAL_MASS
- DELTA_S

There are also some changes in default simulations parameters (PARAMS.TXT), e.g. final state interactions and Coulomb corrections for spectral function are now turned on by default. Some parameters are deprecated and replaced by new ones. New predefined beams and targets are available in new release.

The Singularity container (see <https://nuwro.github.io/user-guide/singularity/>) with NuWro 18.02 is available to make it easier for you to check the new release!
